Exercici de constructors de subclasses

Quina seria l'eixida del següent mètode?

```
public static void main(String[] args){
        Hijo h = new Hijo();
        System.out.println("\nm1 devuelve:" + h.m1());
        System.out.println("\nm2:");
        h.m2();
        System.out.println("\nm3:");
        h.m3();
        System.out.println("\nm4:");
        h.m4();
}
public class Abuelo{
        public int m1(){
                return 0;
        }
        public void m2(){
                System.out.println("Abuelo.m2");
        }
        public void m3(){
                System.out.println("Abuelo.m3");
        }
        public void m4(){
                System.out.println("Abuelo.m4");
        }
}
public class Padre extends Abuelo{
        public int m1(){
                return 1;
        }
        public void m2(){
                super.m2();
                System.out.println("Padre.m2");
        }
        public void m4(int i){
                super.m4();
                System.out.println("Padre.m4");
        }
}
public class Hijo extends Padre{
        public int m1(){
                return super.m1();
        }
        public void m2(){
                super.m2();
                System.out.println("Hijo.m2");
        }
        public void m3(){
                super.m3();
                System.out.println("Hijo.m3");
        }
}
```
